

DocForm™

Automated Electronic & Print Transactional Business Communications

Enables high volume, data-driven
business communications

Highly Personalised Communications

DocForm is the comprehensive personalised communications for production printing and cross-channel messaging for midsize-to-enterprise organisations.

- » Create a single document or related document sets
- » Concurrent inputs from multiple databases & data sources
- » Input directly from print and electronic data streams
- » Change images based on data triggers & variable data
- » One-off personalised paragraphs, offers, bar codes & more
- » Dynamic table fields, charts and graphs

Personalised Business Communications

DocForm is designed for organisations that need to generate high volumes of highly personalised electronic, email, and print business communications. It's ideal for bulk generation of eStatement and printed statements, customer notifications, and other types of complex communications. DocForm quickly creates complex document sets so organisations can easily provide their customers with both print and electronic cross-channel communications.

High Volume Capable & Integrated Workflow

DocForm rapidly generates and processes complex electronic and print documents for production environments. It can generate print output to feed the fastest production print environments.

DocForm's integrated workflow also enables the conditional output of documents based on data and other preset processing rules.

Easily Create Complex Personalised Documents

DocForm creates these complex communications by ingesting data from multiple sources and inputs. These input sources include multiple databases, print queues, XML streams, and many other data sources.

DocForm also processes nested-XML streams to create complex and data-nested statements often used in financial and banking statements.

DocForm can dynamically create QR codes and 95 other styles of barcodes to match all barcode requirements.

DocForm has a project design interface that allows the creation of a wide range of print and electronic communications.

Multiple Output and Delivery Methods
